

Microsoft 365

Corporate service access management

⚠️ Challenge:

- Protect corporate applications and data
- Provide employees a single, convenient tool to access all necessary resources.
- Enable secure infrastructure to prevent unauthorized access to corporate data, applications and services

👍 Solution:

- Unified access portal for all corporate services based on multi-factor authentication scenario (single sign-on)
- Group policy based application access management
- Real-time monitoring and analytics of cloud services used by employees to assess possible threats.

Benefits:

- Simple and reliable access to all corporate services
- Eliminating the possibility of unauthorized usage of credentials by employees
- Reset forgotten passwords without IT help

Scenarios

- Business applications are not accessible via internet
- No group policy or roles based access to corporate services and applications.
- Multi-factor authentication scenarios are not implemented
- No network traffic monitoring and intelligence system that detects third-party cloud services used by employees

Solution capabilities

- Unified portal for publishing external and internal corporate services
- Multi-factor authentication and single sign-on scenarios
- Access management based on group policies
- Transparent monitoring of cloud services used by employees, assessment of possible exploits and fighting with "Shadow IT"

Tech and products

- Azure Active Directory Premium
- Cloud app Security
